🎬 Technology Mask Man — Full Setup Guide

Video Title: I Built an AI That Hacks Websites For Me Legally | HexStrike + Kali Linux + Cloud LLM

Stack: Kali Linux → HexStrike AI → Claude Desktop → Cloud LLM → PortSwigger Lab

📋 Prerequisites

Before starting, confirm your environment:

bash

```
# Verify Kali version
lsb_release -a

# Verify Python
python3 --version    # Must be 3.8+

# Verify Node.js (for Claude Desktop build)
node --version
npm --version

# Verify git
git --version
```

Screen text: “Kali Linux Rolling | Python 3.11 | Node 20 | All green.”

🧩 Part 1: Install HexStrike AI

HexStrike is the bridge that exposes 150+ security tools to your LLM.

Option A: APT Install (Fastest)

bash

sudo apt update

sudo apt install -y hexstrike-ai

This installs both hexstrike_server and hexstrike_mcp as system binaries.

Option B: Manual Install (Recommended for Video — More Control)

bash

cd ~/Desktop

git clone https://github.com/0x4m4/hexstrike-ai.git

cd hexstrike-ai

Create and activate virtual environment

python3 -m venv hexstrike-env

source hexstrike-env/bin/activate

Install Python dependencies

pip3 install -r requirements.txt

Screen note: Show the hexstrike-env folder appearing.

🛠️ Part 2: Install Security Tools

HexStrike orchestrates the tools, but they must be installed separately.

bash

Network & reconnaissance

sudo apt install -y nmap masscan rustscan amass subfinder nuclei fierce dnsenum autorecon theharvester responder netexec enum4linux-ng

Web application security

sudo apt install -y gobuster feroxbuster dirsearch ffuf dirb katana nikto sqlmap wpscan arjun paramspider wafw00f

Password & authentication

sudo apt install -y hydra john hashcat medusa patator crackmapexec evil-winrm hash-identifier

Binary analysis & reverse engineering

sudo apt install -y gdb radare2 binwalk ghidra checksec foremost steghide exiftool

Cloud security

sudo apt install -y trivy

Screen note: Fast-forward this section. Show the list on screen with a “53 tools installed” counter.

🚀 Part 3: Start the HexStrike Server

Open a dedicated terminal and leave it running.

bash

cd ~/Desktop/hexstrike-ai

source hexstrike-env/bin/activate

python3 hexstrike_server.py --port 8888

You'll see the HexStrike banner and:

text

[INFO] Server starting on 127.0.0.1:8888

[INFO] 150+ integrated modules | Adaptive AI decision engine active

Screen text: “HexStrike server live on port 8888.”

✅ Health Check (New Terminal)

bash

curl -s http://localhost:8888/health | jq

Expected: {"status":"healthy","tools_available":73} (number varies).

Common Issue: connection refused

Fix: Make sure the server terminal is still running and you used the correct port.

🖥️ Part 4: Build & Install Claude Desktop

Claude Desktop is your MCP client — the GUI that connects the LLM to HexStrike.

Step 1: Clone the Debian Packaging Repo

bash

```
cd ~/Desktop/hexstrike-ai
git clone https://github.com/aaddrick/claude-desktop-debian.git
cd claude-desktop-debian
```

Step 2: Build the .deb Package

bash

```
chmod +x build.sh
./build.sh --build deb --clean yes
```

This downloads the official Claude Desktop installer, replaces the Windows native module with a Linux-compatible one, and packages it.

Common Issue: Missing dependencies

Fix:

bash

```
sudo apt install -y nodejs npm jq wget curl
```

Step 3: Install the Built Package

After the build completes (5–15 minutes), you'll see two .deb files:

bash

```
ls -la *.deb
```

Install the large one (the real package):

bash

```
sudo dpkg -i claude-desktop-unofficial_*.deb
sudo apt --fix-broken install -y
```

Common Issue: chrome-sandbox permissions

Fix: The installer usually handles this. If you see an error:

bash

```
sudo chown root:root /usr/lib/claude-desktop-unofficial/chrome-sandbox
sudo chmod 4755 /usr/lib/claude-desktop-unofficial/chrome-sandbox
```

Step 4: Launch Once to Create Config

bash

```
claude-desktop-unofficial &
```

Close the window after it opens. Then verify the config directory:

bash

```
ls -la ~/.config/Claude/
```

Common Issue: claude-desktop: command not found

Fix: The binary is named claude-desktop-unofficial, not claude-desktop.

🔌 Part 5: Configure HexStrike MCP Server

Step 1: Edit the Config File

bash

```
nano ~/.config/Claude/claude_desktop_config.json
```

Step 2: Add the MCP Server Block

Merge this into the existing JSON (keep your preferences block):

json

```
{
"mcpServers": {
"hexstrike-ai": {
"command": "/home/kali/Desktop/hexstrike-ai/hexstrike-env/bin/python",
"args": [
"/home/kali/Desktop/hexstrike-ai/hexstrike_mcp.py",
"--server",
"http://localhost:8888"
],
"env": {
"HEXSTRIKE_SERVER": "http://localhost:8888",
"HEXSTRIKE_TIMEOUT": "300"
}
}
}
}
```

Critical notes:

command must be the Python inside your virtual environment.

--server port must match your running HexStrike server (8888 by default).

Use absolute paths, not ~.

Common Issue: MCP server disconnects immediately

Fix: Test the MCP script manually:

bash

/home/kali/Desktop/hexstrike-ai/hexstrike-env/bin/python /home/kali/Desktop/hexstrike-ai/hexstrike_mcp.py --server http://localhost:8888 --debug

If it errors, you'll see the exact reason in the terminal.

✅ Part 6: Launch & Verify

Step 1: Restart Claude Desktop

bash

pkill -f claude-desktop-unofficial

sleep 2

claude-desktop-unofficial &

Step 2: Verify MCP Connection

In a new conversation, type:

What tools do you have available?

Claude should list tools like:

nmap_scan()

gobuster_scan()

nuclei_scan()

sqlmap_scan()

httpx_scan()

Common Issue: No tools appear

Fix checklist:

Is hexstrike_server.py still running?

Are paths in config 100% correct? (Run cat ~/.config/Claude/claude_desktop_config.json)

Did you fully quit Claude Desktop (not just close the window)?

Check logs:

bash

cat ~/.config/Claude/logs/mcp-server-hexstrike-ai.log
